apyrase (EC 3.6.1.5) precursor - potato
NiAlternate names: adenylyprophosphatase; ATP-diphosphohydrolase
NiAlternate names: adenylyprophosphatase; ATP-diphosphohydrolase
C;Species: Solamum tubercosum (potato)
C;Date: 10-May-1996 #sequence_revision 19-Jul-1996 #text_change 09-Jul-2004
C;Species: 0n-May-1996 #sequence_revision 19-Jul-1996 #text_change 09-Jul-2004
C;Accession: Judgits; PC4147

Chem. 275:2057-2062(2000).

-I. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleorides to regulate purinergic neurotransmission. Could als be implicated in the prevention of platelet aggregation.

Hydrolyzes ATP and ADP equally well.

-I. CATALTITC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.

-I. CATALTITE Requires calcium and magnesium.

-I. SUBGNIT: Homodiner; disulfide-linked (By similarity).

-I. SUBGLULAR LOCATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleotides to regulate purinergic neurotransmission. Could be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.

-!- CATALYTIC ACTIVITY: ATP + 2 H(2)O = AMP + 2 phosphate.
-!- COFACTOR: Requires calcium and magnesium.
-!- SUBUNIT: Homodimer; disulfide-linked (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (Potential).

Purification and N-terminal sequence of the stomach ecto-apyrase.";

J. Biol. Chem. 272:23645-2365(1997).

J. Biol. Chem. 272:23645-2365(1997).

L. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally wall (By similarity).

L. CATALYTIC ACTIVITY: ATTP + 2 H(2)O = AMP + 2 phosphate.

C. CATALYTIC ACTIVITY: ATTP + 2 H(2)O = AMP + 2 phosphate.

C. SUBLOIT: Homodimer; disulfide-linked (Probable).

C. SUBCELLULAR LOCATION: Integral membrane protein (Potential).

C. I = FTM: N-glycosylated.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

location/Qualifiers

```
The present sequence is a fusion construct, comprising the N-terminal anino acids of mature human interleukin2 (IL2) and soluble CD39 (solCD39) region, that has apyrase activity. This results in high levels of solCD39 captression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It constructed by removing the N- and C-terminal transmembrane domains. It constructed by removing the N- and C-terminal transmembrane domains. It constructed by the N- and creates and concentrations and transment, including platelet adgregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease cor injury, atherosclerosis, peripheral ascular occlusion, preeclampsia, embolism, platelet-associated ischemic disorders including lung, coronary and cerebral ischemia, thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DYT), pulmonary chorons preventing thrombus formation or reformation, occlusion, reocclusion, rectivation, reformation, occlusion, reocclusion, rectivation, reformation, reformation, rectivation,
disease or injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               stenosis or restenosis of blood vessels or stroke

```
The present sequence is the protein enocoded by a fusion construct of sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solch39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is used in the treatment of unstable angina, transfected cells. This is used in the treatment of unstable angina, and cransfected cells. This is used in the treatment of unstable angina, coronary considerated inchemial infarction, stroke, coronary collusion, preeclampsia, embolism, platelet-associated ischaemia, thrombosis, intracardiac thrombosis, inchaemia and cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, intracardiac thrombosis, peripheral artery thrombosis (PUT), pullmonary embolism (PE), coagulopathy, deep venous thrombosis (PUT), pullmonary embolism (PE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GISKFVQKVNBIGIYLTDCMERAREVIPRSQHQETPVYLGATAGMRLLRMESEELADRVL 120

The present sequence is the fusion protein construct, pIL2LTrim4. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solCD39) protein region, having apyrase activity.

Could cD39 is constructed by removing the N- and C-terminal constructed by removing the N- and C-terminal constructed by removing the N- and creatablie ATP and ADP ctransmembrane domains. It retains the capacity to metabolise ATP and ADP ctransmembrane domains. It retains the ability to block and reverse ADP-construction and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting aggregation. Soluble CD39 polypeptides are useful for inhibiting theory capacital infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, precelampsia, platelet-capsociated ischaemic disorders including lung, coronary and carebral ischaemia, thrombosic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, consulpathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombosis formation, or reformation, occlusion, stenosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 GISKFVOKVNEIGIYLTDCMERAREVIPRSOHOETPVYLGATAGMRLLRMESEELADRVL 120

The present sequence is the protein encoded by Trim4 construct. pIL2Trim4 variant was construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 residues from solCD39 fusion construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of mature expression and activity in the supernatants of transfected cells. SolCD39 stored, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, a thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, coagulopathy, deep venous thrombosis, thrombosis, coagulopathy, deep venous soluble CD39 is also useful for preventing thrombus formation of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of the coast of
                                                             soluble CD39; ADP-induced platelet activation; platelet aggregation; unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; lung ischaemia; thrombolism; cerebral ischaemia; thrombosis; intracardiac thrombosis; coronary artery thrombosis; peripheral artery thrombosis; intracardiac thrombosis; venous thrombosis; peripheral artery thrombosis; coagulopathy; deep venous thrombosis; peripheral artery thrombosis; restenosis; attack; thrombus formation; occlusion; recoclusion; stenosis; restenosis; antianginal; cardiant; cerebroprotective; antiarteriosclerotic; vasotropic; anticoagulant; coronary ischaemia; vascular occlusion; pll2Trim4 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39

   The present sequence is the fusion protein construct, pIL2ITrim3. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solCD39) protein region, having apyrase activity.

Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains It retains the capacity to metabolise ATP and ADP transmembrane domains It retains the capacity to metabolise ATP and ADP induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angereast it is useful for the treatment of unstable angula, stroke, myocardial infarction, coronary attery disease or injury, embolism, atherosclerdsis, peripheral vascular occlusion, preclampsia, platelet associated isorders including lung, coronary and cerebral associated isorders including lung, coronary and cerebral associated isorders including coronary, peripheral and cerebral artery thrombotic disorders including coronary, peripheral and cerebral artery thrombotic disorders including coronary embolism (PB) and translent isohaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence is the protein encoded by Trim3 construct. pIL2Trim3 variant was constructed by removing the human IL2 residues from solD39 (Tusion construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolCD39 corporated in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosolerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, a thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery trombosis, intracardiac thrombosis, peripheral artery thrombosis (thrombosis, coagulopathy, deep venous thrombosis, thrombosis, coagulopathy, deep venous thrombosis, benous formation or seformation, occlusion, reocclusion, stenosis or restenosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The present sequence is a fusion construct pIL2LsolCD39, comprising the cader peptide of human interleukin 2 (HIL2), 12 amino acids from the mature N-terminus of hIL2 and soluble CD39 (solCD39) coding region, having apyrase activity. This produces high levels of solCD39 expression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and carcuitment, including platelet aggregation. Soluble CD39 polyPeptides crecuitment, including platelet aggregation. Soluble CD39 polyPeptides cornitable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, coronary and cerebral ischaemia, thrombotic disorders including lung, coronary and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (born preventing thrombus formation or reformation, occlusion, reocclusion, for preventing thrombus formation or reformation, celusion, reocclusion, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporation, corporatio

Pusion of 12 amino acids from the N-terminus of mature human is the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, aherosclerosis, peripheral vascular occlusion, precclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary artery thrombosis, cerebral acheria thrombotic disorder including coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the fusion protein construct pliziFlagSolCD39, comprising the leader peptide of human interleukin 2 (hliz), 12 amino acids from the mature N-terminus of hliz, a linker, FlAG tag sequence and soluble CD39 (solCD3) protein region, that has apyrase activity. This produces high levels of solCD39 expression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrana domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting and recomplication, soluble CD39 polypeptides are useful for inhibiting corroration, errors, considered infarction, errors, consury artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, embolism, correbral ischaemia, thrombotic disorders including coronary and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä

The present sequence is encoded by soluble CD39(solCD39) expression plasmid. This was used for the transient expression of solCD39 protein in mammalian expression systems. SolCD39 is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia and cerebral ischaemia, thrombocic disorder including coronary artery thrombosis, cerebral artery thrombocic disorder including coronary artery thrombosis, peripheral artery thrombosis, thrombosis, thrombosis, thrombosis, cagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombos formation or reformation, occlusion, reocclusion,

The present sequence is a fusion protein construct CD39-L4-1, comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CD39-L4 is a secreted apyrase, belonging to the CD39 family. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides recruitment, including platelet aggregation. Soluble CD39 polypeptides or unstable angina, myocardial infarction, stroke, coronary artery disease. Or injury, atherosclerosis, peripheral vascular occlusion, pracelampsia, coronary and cerebral ischaemia, thrombotic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, reocclusion, reocclusion,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   126
